

● Part 1: Public Variables — 5 Questions

Q1. Student

Create a Student class with a public variable name. Create an object and print the name.

Q2. Car

Create a Car class with a public variable brand. Create an object and print the brand.

Q3. Book

Create a Book class with a public variable title. Create an object and print the title.

Q4. Employee

Create an Employee class with a public variable name. Create an object and change the name from outside the class.

Q5. Mobile

Create a Mobile class with a public variable model. Create two objects with different models and print both.

● Part 2: Protected Variables — 5 Questions

Q6. Student

Create a Student class with a protected variable `_age`. Create an object and try to access `_age` from outside the class.

Q7. Car

Create a Car class with a protected variable `_model`. Create an object and print `_model`.

Q8. Employee

Create an Employee class with a protected variable `_salary`. Create an object and try to change `_salary` from outside the class.

Q9. Bank Account

Create a BankAccount class with a protected variable `_account_type`. Create an object with "Savings" and print it.

Q10. Laptop

Create a Laptop class with a protected variable `_price`. Create an object and change `_price` from outside the class.

Part 3: Private Variables — 5 Questions

Q11. Student

Create a Student class with a private variable `__marks`. Create an object and try to print `__marks` from outside the class.

Q12. Bank

Create a Bank class with a private variable `__balance`. Create an object and try to access `__balance` directly.

Q13. Employee

Create an Employee class with a private variable `__salary`. Create an object and try to print the salary from outside the class.

Q14. Account

Create an Account class with a private variable `__pin`. Create an object and try to access the PIN directly.

Q15. Mobile

Create a Mobile class with a private variable `__password`. Create an object and try to change the password from outside the class.

Final Challenge — Separate Practice

After completing these, answer these three questions **separately**:

A. Public

What happens when you access a public variable from outside the class?

B. Protected

What does `_variable` mean in Python, and can it technically be accessed from outside the class?

C. Private

What happens when you try to directly access a `__variable` from outside the class?
